

A12

1/12-SCALE ELECTRIC ON-ROAD CAR

INSTRUCTION MANUAL

INTRODUCTION

Congratulations on purchasing your Awesomatix car!
The A12 car was produced by UAB Awesomatix company.

BEFORE YOU START

The A12 car is the high-quality, innovative 1/12-scale on-road car and should be built only by persons with previous experience building R/C model racing cars.

This is not a toy and is not intended for use by children without direct supervision of a responsible, knowledgeable adult. Read the instruction manual carefully and fully understand it before beginning assembly. If you have any problems or questions please do not hesitate to contact the Awesomatix team at support@awesomatix.com. If, for any reason, you decide that you do not want your A12 car you must not begin assembly.

Your A12 car cannot be returned to UAB Awesomatix for a refund or exchange if it has been fully or partially assembled.

This kit is a radio controlled model racing product and could cause harm and personal injury.

The A12 car is designed for use on r/c car race tracks. It should not be used in general public areas.

UAB Awesomatix accept no responsibility for any injuries caused by making or using this kit.

Due to policy of continuous product development the exact specifications of the kit may vary.

UAB Awesomatix do reserve all rights to change any specifications without prior notice. All rights reserved.

ASSEMBLY NOTES

You can find the useful tips of A12 assembling and the **A12 editable setup sheet** on the Internet site:

<http://site.petitrc.com/reglages/awesomatix/setupa12/>

GENERAL PRECAUTIONS

- Many of the items in this kit are small enough to be accidentally swallowed and are therefore potential choking hazards, making them potentially fatal. Please ensure that when assembling the kit you do so out of the reach of small/young children.
- Take care when building, as some parts may have sharp edges.
- Please read this manual carefully to understand which ancillary items (tools, electrics, electronics etc) are used with this kit. Awesomatix Innovations accept no responsibility for the operation of any such ancillary items.
- Exercise care when using tools and sharp instruments.
- Follow the operating instructions for the radio equipment at all times.
- Never touch rotating parts of the car as this may cause injury.
- Keep the wheels of the model off the ground when checking the operation of the radio equipment.
- To prevent any serious personal injury and/or damage to property, be responsible when operating all remote controlled models.
- The model car is not intended for use on roads or areas where its operation can conflict with or disrupt pedestrian or vehicular traffic.
- Do not run your car in poor light or if it goes out of sight. Any impairment to your vision may result in damage to your car or, worse, injury to others or their property.
- As a radio controlled device, your car is subject to radio interference from things beyond your control. Any such interference may cause a loss of control of your car so please consider this possibility at all times.
- When not using RC model, always disconnect and remove battery.
- Insulate any exposed electrical wiring to prevent dangerous short circuits. Take maximum care in wiring, connecting and insulating cables. Make sure cables are always connected securely. Check connectors for if they become loose and if so reconnect them securely. Never use R/C models with damaged wires. A damaged wire is extremely dangerous and can cause short-circuits resulting in fire.

EQUIPMENT RECOMMENDED (NOT INCLUDED)

- Radio Transmitter
- Radio Receiver
- Electronic Speed Control
- Steering Servo
- Servo Saver
- Electric Motor
- Pinion Gear (64 or 48 Pitch)
- Spur Gear (64 or 48 Pitch)
- 1S Li-Po Battery
- 1/12 scale Body Shell
- 1/12 scale Wheels and Tires

TOOLS RECOMMENDED (NOT INCLUDED)

- 1.5mm, 2.0mm, 2.5mm Hex Drivers
- 12mm Wrench
- Sewing Needle or Sharp Pin
- Callipers
- Hobby Knife
- Ride Height Gauge
- Thin CA Glue
- Thread Lock
- Double Side Tape
- Silicone Oil for Dampers
- Joint Grease

STEP 1

Note: **SH1.5W** is 7.4x3x1.5mm alloy spacer.

STEP 2

Note:
SB3X5AL is 3x5mm alloy screw.

STEP 3

STEP 4

Use blue "soft" thread lock for **SS3X4** screw!

Note: Add small amount of a joint grease between **ST1205** and **ST1209M/L**.

Rear ball joint

Note: **SS3X4** set screw tips should just slightly touch **AM1204** chassis surface.

Front ball joint

STEP 5

Note: Add a bit of silicone oil into groove of **ST1202**.

Note: Lubricate **OR153V** via silicone oil. Stretch **OR153V** via fingers and put it on **ST1202** (to avoid the damage of o-ring please don't use a sharp edged tool for this!).

STEP 6

Note: Add ~0,3 g of 50 000...100 000 cst silicone oil into cavity of **ST1204** damper case. We recommend 100 000 cst silicone oil as the base setup. Keep **ST1204** upright for several minutes until all oil reaches the bottom of the cavity.

STEP 7

Note: Insert **ST1202** damper rotor into **ST1204** damper case slowly.

After the lower face of the **ST1202** reaches the oil in the bottom of the cavity, the **ST1202** will need an additional force to be pushed fully into the proper position. We recommend using a rubber band or **OR230** o-ring as shown in the picture. The oil will start to come up towards the top of the cavity of the **ST1204** as the **ST1202** is pushed further into that cavity by the o-ring. When the **OR153V** o-ring and the **ST1204** damper are close to flush (almost fully inserted), please use a sewing needle or a sharp pin along the recess of the **ST1202** to move the o-ring out of position and allow more oil to be pushed out from the **ST1204** case. Using this needle or pin will allow the **ST1202** to be fully seated and sit perfectly flush with the **ST1204** damper case.

Note: It is very important to assemble the damper without any air inside! The silicone oil has to occupy the gap between the damper's rotor and case fully. It can take some practice.

STEP 8

Repeat the STEPS 5,6,7 for other side of **ST1204** and check that both **ST1202** rotors reached the desirable position (flush with the **ST1204** face)

STEP 9

Note: **SS3X10** set screw is used for adjusting of the rear downstop. An exact position of this **SS3X10** screw will be set later during setup of the car. Please use blue "soft" thread lock for this screw.

STEP 10

STEP 11

Note: ST1201 ball studs should be placed into slots of ST1202 rotors.

STEP 12

STEP 13

Press both **B168ZZ** bearings into **AT1203** rear beam.

STEP 14

Note: **ST1208** steering block posts provide 4 deg caster.
Optional **ST1208-C5** posts provide 5 deg caster.

The tip of 1,5mm hex driver or optional **RHG 4.2** probe is used for alignment of the appropriate holes of **ST1208** and **C1205**.

Alignment of the appropriate holes of **ST1208** and **C1205** for camber settings.

STEP 15

Note orientation of **DT1202**

STEP 16

Note: **SPR12FS** Front Soft Springs (Silver) and **SPR12FM** Front Medium Springs (Gold) come in the **A12** kit.

SH12S-0.2 0.2mm thickness shims are used to set the front spring preload and the front ride height.

Top **SH12S-0.2** shims

ST1207

Bottom **SH12S0.2** shims

Attention! When installing **SH12S0.2** shims, make sure they surround the **ST1207** but not below or above the **ST1207** end faces.

STEP 17

Installation of the SANWA SRG servo.

Installation of the standard mini servo.

Note: ST24-4.0 are 4.0mm ball studs. ST24-4.0 fit P1213 4.0mm ball cups.

STEP 18

Installation of the SANWA SRG servo.

Installation of the 15mm thick mini servo.

STEP 19

Install both steering links.

Note: P1213 4.0mm ball cups are used for the inner steering joints.

STEP 20

Rear body holders assembling.

Note: Press **P06-1** collars into **C1203** from lower face of **C1203** and apply a drop of CA glue to set them.

STEP 21

STEP 22

Note: Use thin double sided tape to secure **P1215** foam bumper on **C1204** bumper plate.

STEP 23

Note: Use **OR91** 9x1mm o-ring with the thick spur gears. Use **OR915** 9x1.5mm o-ring with the thinner spur gears (TC-style spur gears).

Note: The sum of the 64P spur+pinion teeth should be within 112-120 range for short wheel base and within 112-125 range for +1mm longer wheel base.

Note: Tighten **AT1215** nut via 12mm wrench. Please don't overtighten **AT1215** nut!

STEP 24

Carbon Spool set **CS-1** (optional).

Note: Two **SB3X5AL** M3x5 alloy screw with one **SB3X6** M3x6 steel screw are used for perfect axial balancing of the right wheel hub.

STEP 25

Note: The sum of the 64P spur+pinion teeth should be within 112-120 range for short wheel base and within 112-125 range for +1mm longer wheel base.

STEP 26

Note: Combination of SH12F0.5 spacers on both sides of the front wheel is used for the front width adjustment.

Note: Use SC3X5 or SC3X6 depending of the rear rims chosen. Some rims may need optional 3x8 mm screws (not included).

STEP 27

Install:

Speed controller (not included),
Receiver (not included),
Battery (not included),
Transponder (not included).

RHG 4.2 Ride Height Gauge (optional)

RHG 4.2 gauge is designed for setting and measuring the ride height under rear damper of the **A12** car (**DRH** - Damper Ride Height) and can be also used for setting and measuring of the front ride height (**FRH**) and the rear ride height (**RRH**).

RHG 4.2 gauge provides a 3.0 - 4.2mm range for ride height measuring without **ST1215** spacer. With **ST1215** spacer the gauge provides a 4.0 - 5.2mm and 4.5 - 5.7mm ranges (positions **" +1 "** and **" +1.5 "** of **ST1215** spacer).

ST1215 RHG Spacer

ST1214 RHG Probe

AT1210 RHG Indicator

" +1 " RHG Spacer position for ride height measuring within 4.0 - 5.2 mm range.

" +1,5 " RHG Spacer position for ride height measuring within 4.5 - 5.7mm range.

The **DRH** - ride height under rear damper measuring.

The **RRH** - rear ride height measuring.

The **FRH** - front ride height measuring.

Setting of the DRH - the ride height under rear damper.

The ride height under rear damper (**DRH**) is set via preload of two side coil springs **SPR12S** in conjunction with the optional additional preload via set screws in the two side beams **AM1205**. These beams act as springs when the screws in them press on the **AM1204** chassis plate.

A12 setup sheet includes two values for the rear ride height. **DRH 1** shows the ride height resulting from side spring pressure only, without the use of **AM1205** side beams. **DRH** ride height is the final ride height of the car (which can be a combination of both side springs and side bars to reach this final desired height). For example, **DRH1** (damper ride height set with only side spring pressure) will equal **DRH** when side beams are not being used, as there is no additional side beam pressure.

AM1205 side beams act as an additional spring when these set screws are set to touch the **AM1204** outer plate. The rearmost position of the set screws provides the stiffest vertical suspension rate, and the front most position the softest vertical suspension rate. These side beams can also be used without any set screws for a small increase in the cars overall vertical stiffness. Please use blue "Soft" thread lock on any set screws used.

Setting of the Rear Droop.

Adjusting of **SS3X10** set screw depth (**Droop Screw Depth**) is used for setting of the rear suspension droop (**Rear Droop**).

Droop Screw Depth can be measured via calipers or via counting of the number of turns the screw is screwed into damper's case. Every turn of the thread is 0,5mm in depth. So for example, 4 full turns of **SS3X10** screw starting from position when the lower face of the screw coincides with the lower face of the damper corresponds to 2mm **Droop Screw Depth**. Enter **Droop Screw Depth** value into the **A12** editable setup sheet. The rear droop value will be calculated automatically based on the **DRH** and **RRH** data.

When using big tires, you will need to use shims under the C1205 to obtain the desired ride height. Placing shims under the steering block will not be sufficient to lower the ride height to proper height with larger tire sizes, so please use this additional method of adding shims under the C1205
